Information

The Silenceair weather louvre and long draft spray cup is designed to be installed in a variety of wall scenarios where the external wall material is at least 60mm thick, such as HEBEL Power panels, or PRONTO panels.

The weather louvre is designed to exclude most rain, and the spray cup is designed to capture windblown spray. Any spray collected will simply drain back outside through the slats of the weather louvre.

An insect screen is included in the system, as well as colour coordinated stainless steel screws.

Installation diagram with Silenceair 140mm acoustic wall vent.

The weather louvre and storm cup are designed to slot into the air intake of the Silenceair 140mm unit.

The weather louvre is designed to accommodate a variety of external wall thicknesses.

When installed, only the slim lines of the weather louvre are visible, offering a far more aesthetic solution than traditional storm louvres.
